Importance **Ranking** in complex network

Importance ranking in complex network (vital nodes detection)

— which nodes are important?

Food web

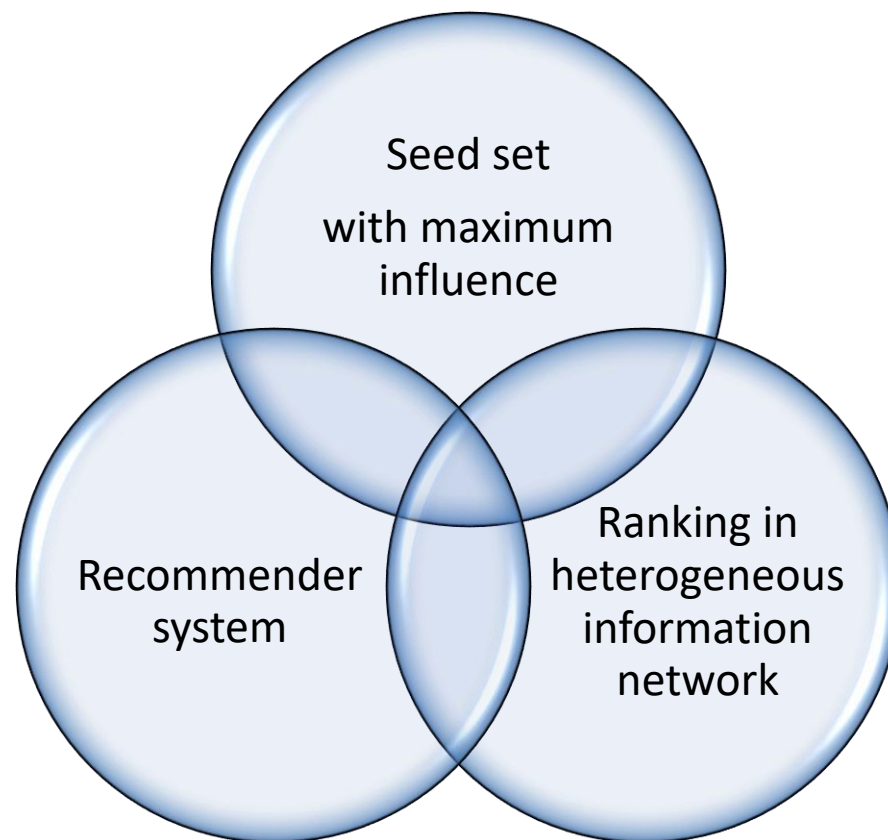

Protein network

Social network

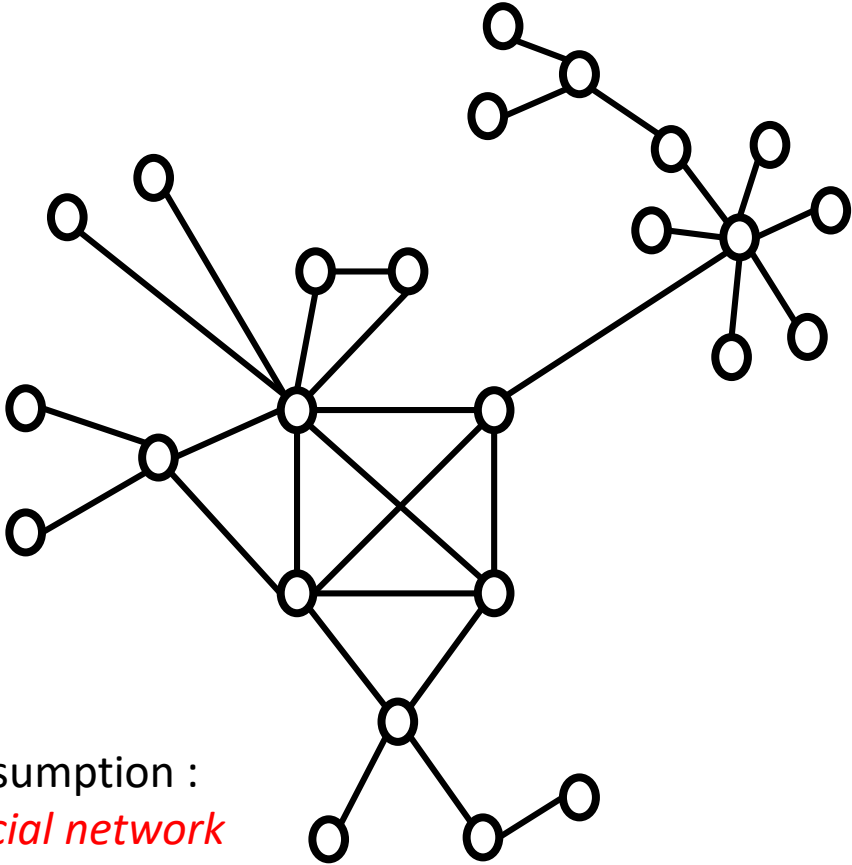

Traffic network

Importance **Ranking** in complex network

Question : **Which nodes** are important for you and **why**?

Assumption :
social network

Node-based

Edge-based

Neighbor-based Ideas(intuitive) :

One-order neighbors(degree) : degree centrality.

Two-order neighbors : semi-local centrality.

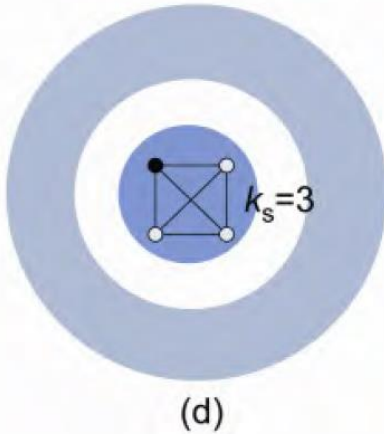

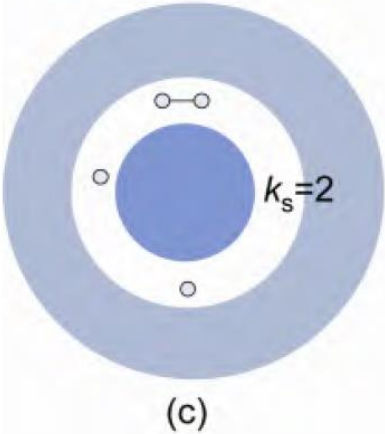

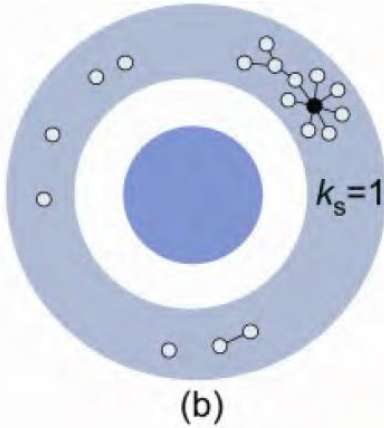

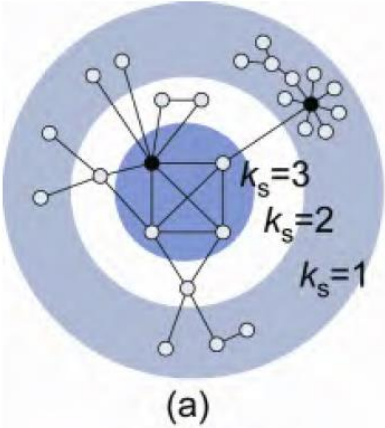

naive

Node with more neighbors is more important ?

Location-based Ideas :

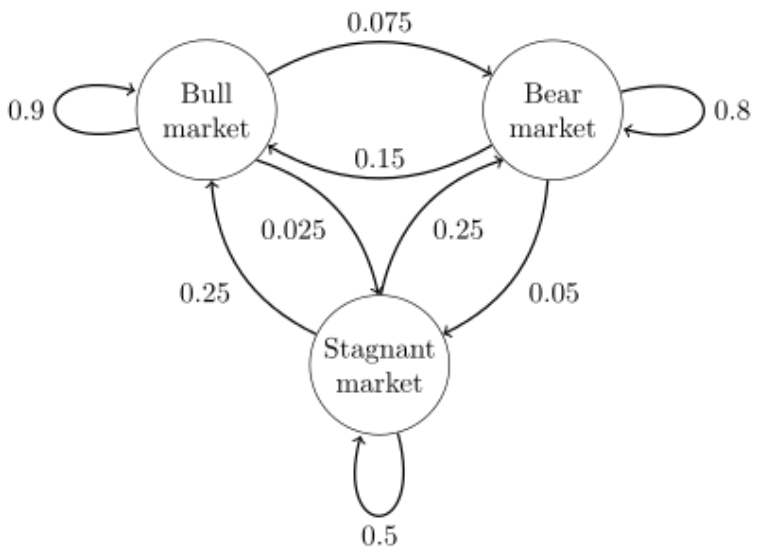

e.g. Node *a* and node *b* have same degree, which is more important?

Node *a* is more important than node *b*, since node *a* is closer the **network centre**.

Neighbor-based Ideas :

Not only the number of its neighbors matter, but also the importance of these neighbors is critical.

The Markov Chain

PageRank

Path-based Ideas :

Consider the ability of a node **to control information**.

The shortest path is addressed.

Which node is more important?

Betweenness centrality

Closeness centrality

Eccentricity

Katz centrality

...

Diffusion-based Ideas :

The important nodes could diffuse a large scale(SIR model).

Terminal condition :

1. All nodes are infected.
2. no one is infected in a step

Infection probability : r ;

Recover probability : 1 ;

Some key conceptions : cascade, infection probability.

Diffusion-based Ideas :

The important nodes could diffuse a large scale(IC model).

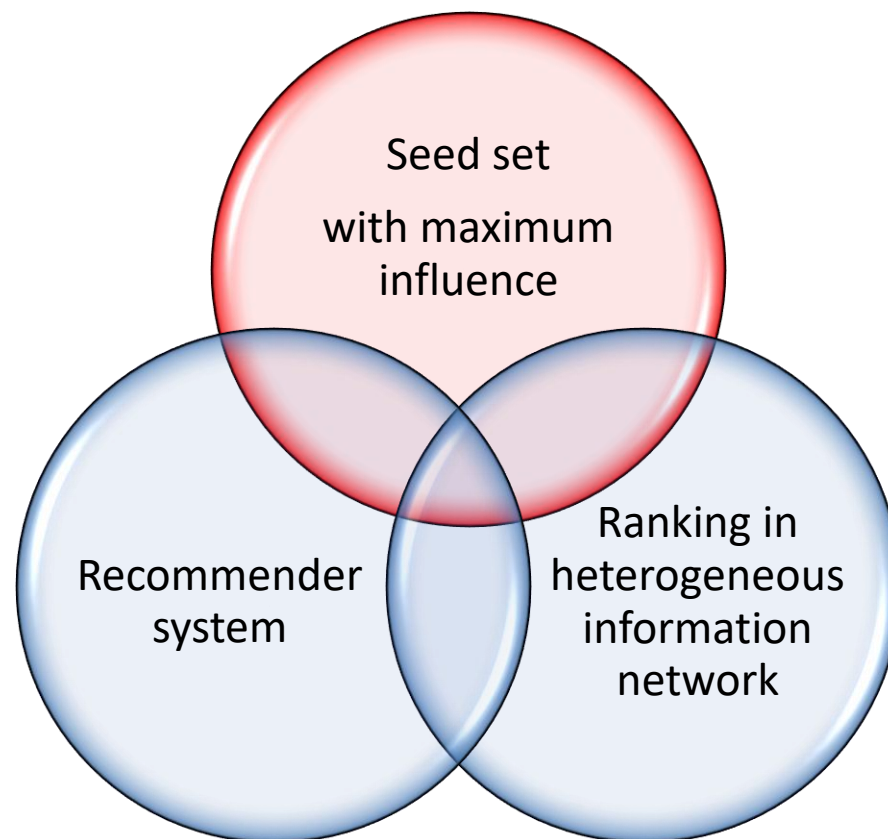

Terminal condition :

1. All nodes are infected.
2. no one is infected in a step

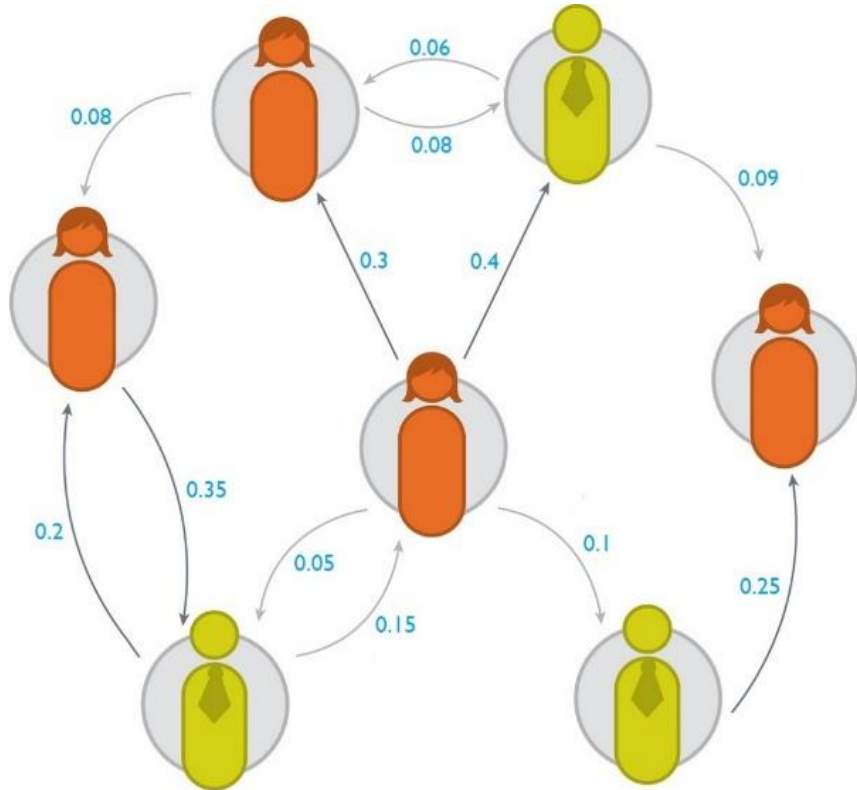

Infection probability : r ;

Some key conceptions : LT model.

Importance **Ranking** in complex network

Input:

Social graph with influence probabilities of edges

Problem:

- Select k individuals such that by activating them, the expected spread of influence is maximized.

Output:

Seed set of size k

Identify influential customers

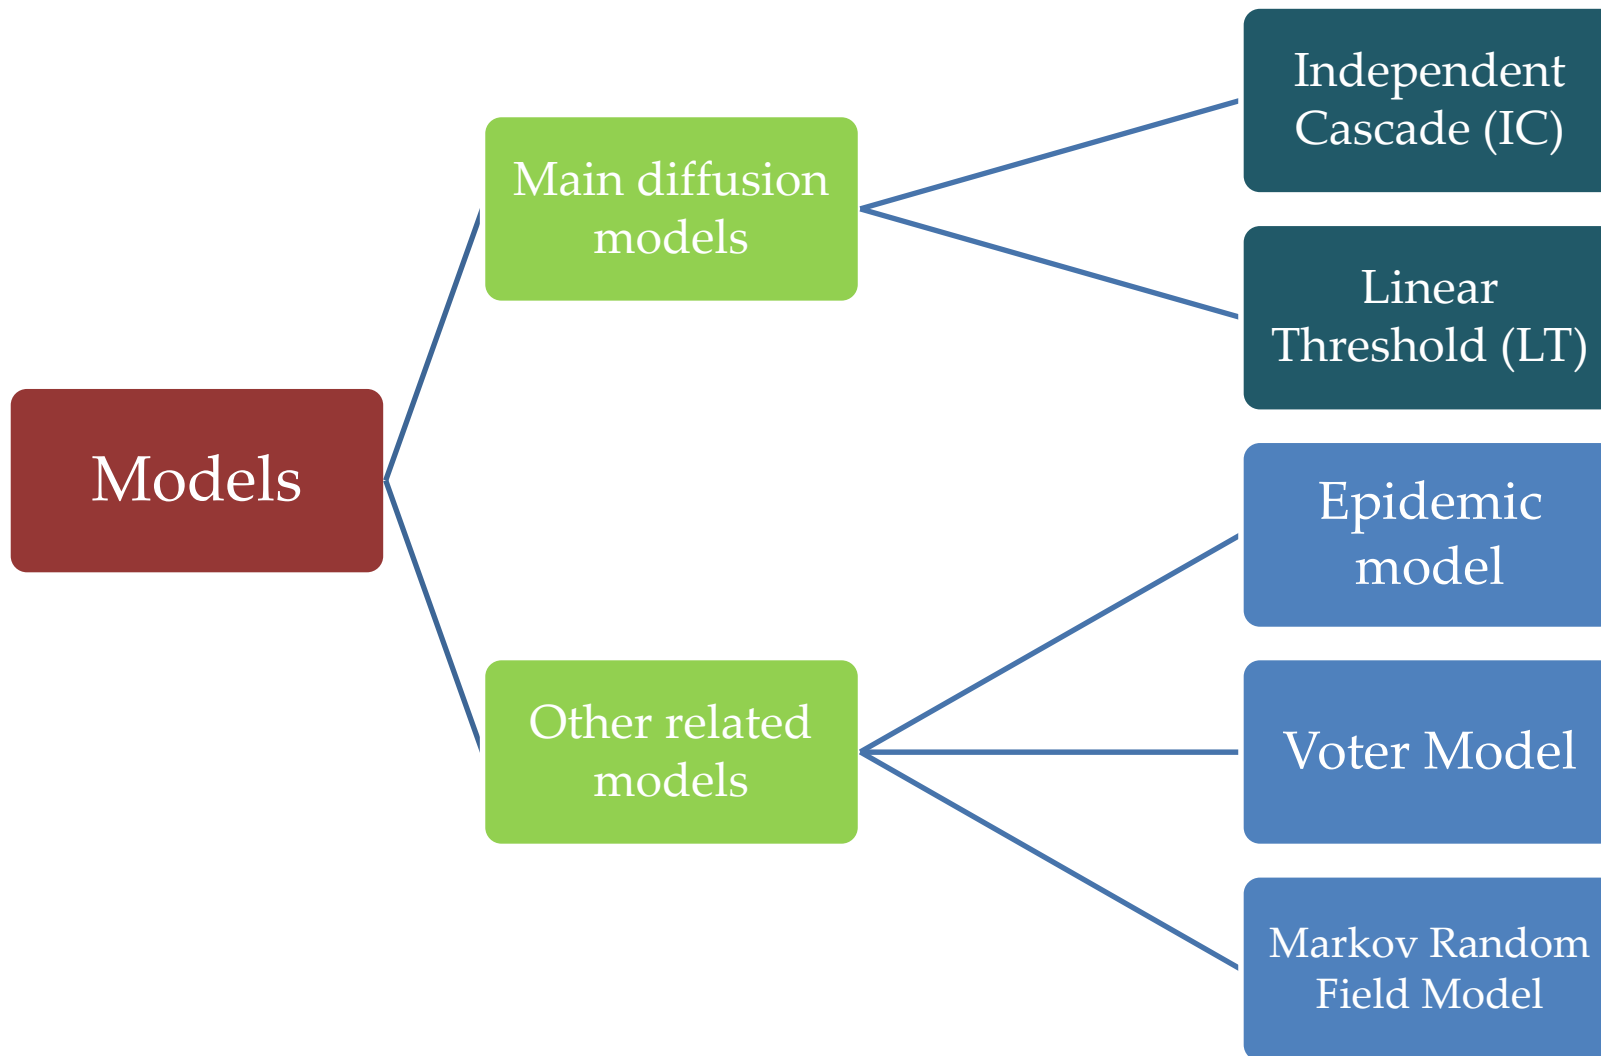

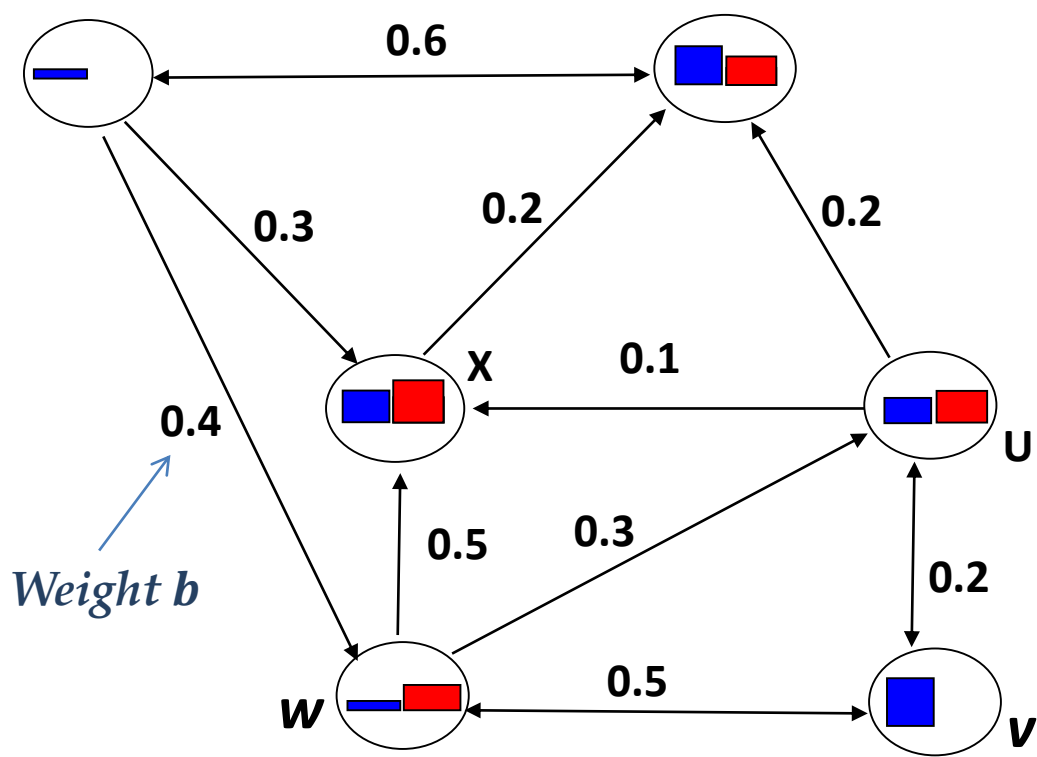

Convince them to adopt the product – Offer discount/free samples

These customers endorse the product among their friends

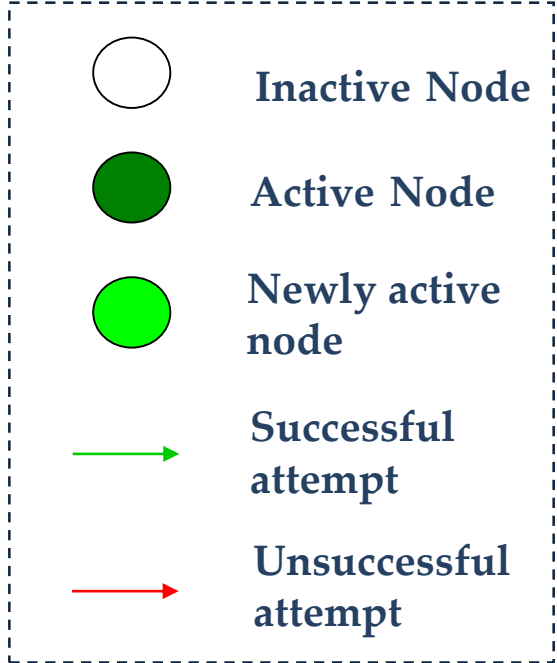

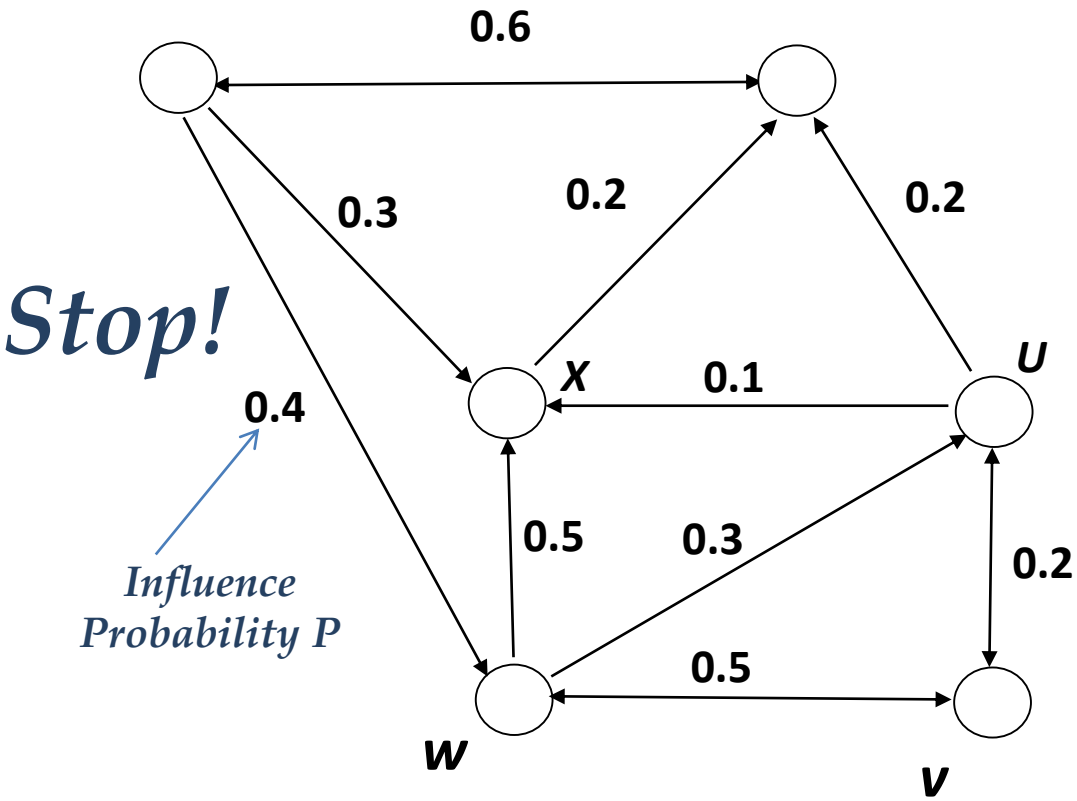

- Inactive Node
- Active Node
- Threshold
- Incoming Influence

Stop!

Node become active when the summation of incoming influences is greater or equal than its threshold.

$$\sum b(v, w) \geq \theta$$

In this case, let's say the global threshold $G= 0.2$

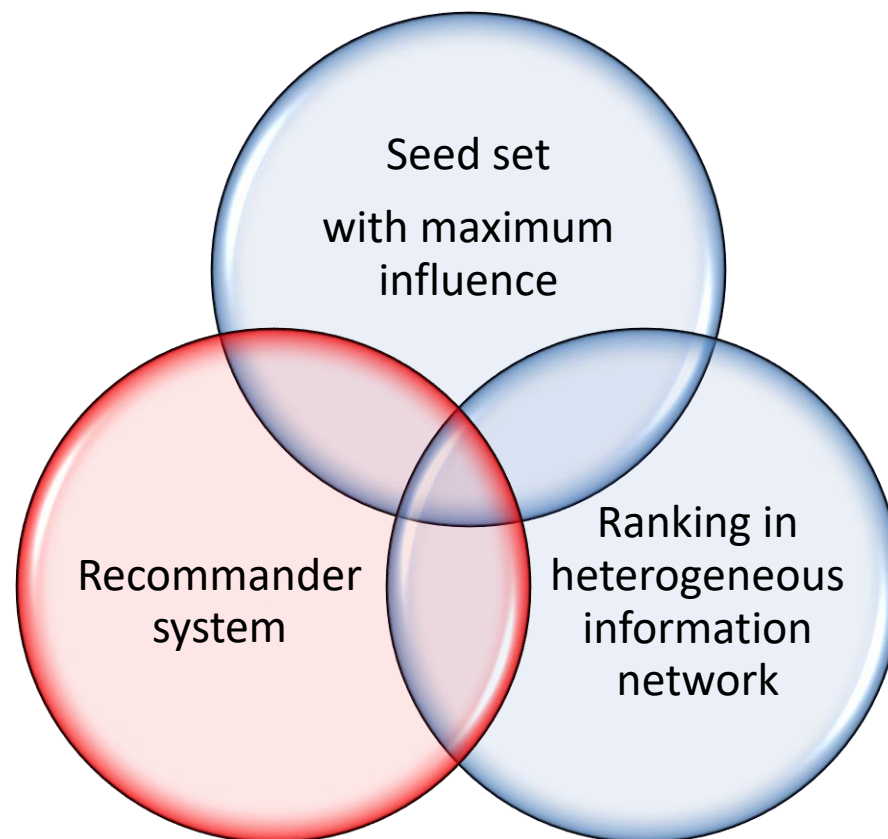

A node is activated once its incoming influence probability $P(v,w)$ is larger than global threshold G .

$$P(v,w) > G$$

➤ Based on the previous researches....

- Influence probability/weight on the edge are based on *assumption*. How can we get the real influence probability/weight?
- In a social network, does influence probability/weight remains constant over time?
- The influence only come from neighbours? Is there any other source of influence?

- Nodes only have positive influence?
- Each node has only 2 influence status (Active and inactive). How about having 3 status (“Inactive”, “Influence & adopt” and “Influence & Impart”)?
- Focus only maximization on a single network based on the given constraint. How about maximize multiple social networks at once?

Importance **Ranking** in complex network

What's our goal?

We want to

infer

The **Reserved Price**
For each user

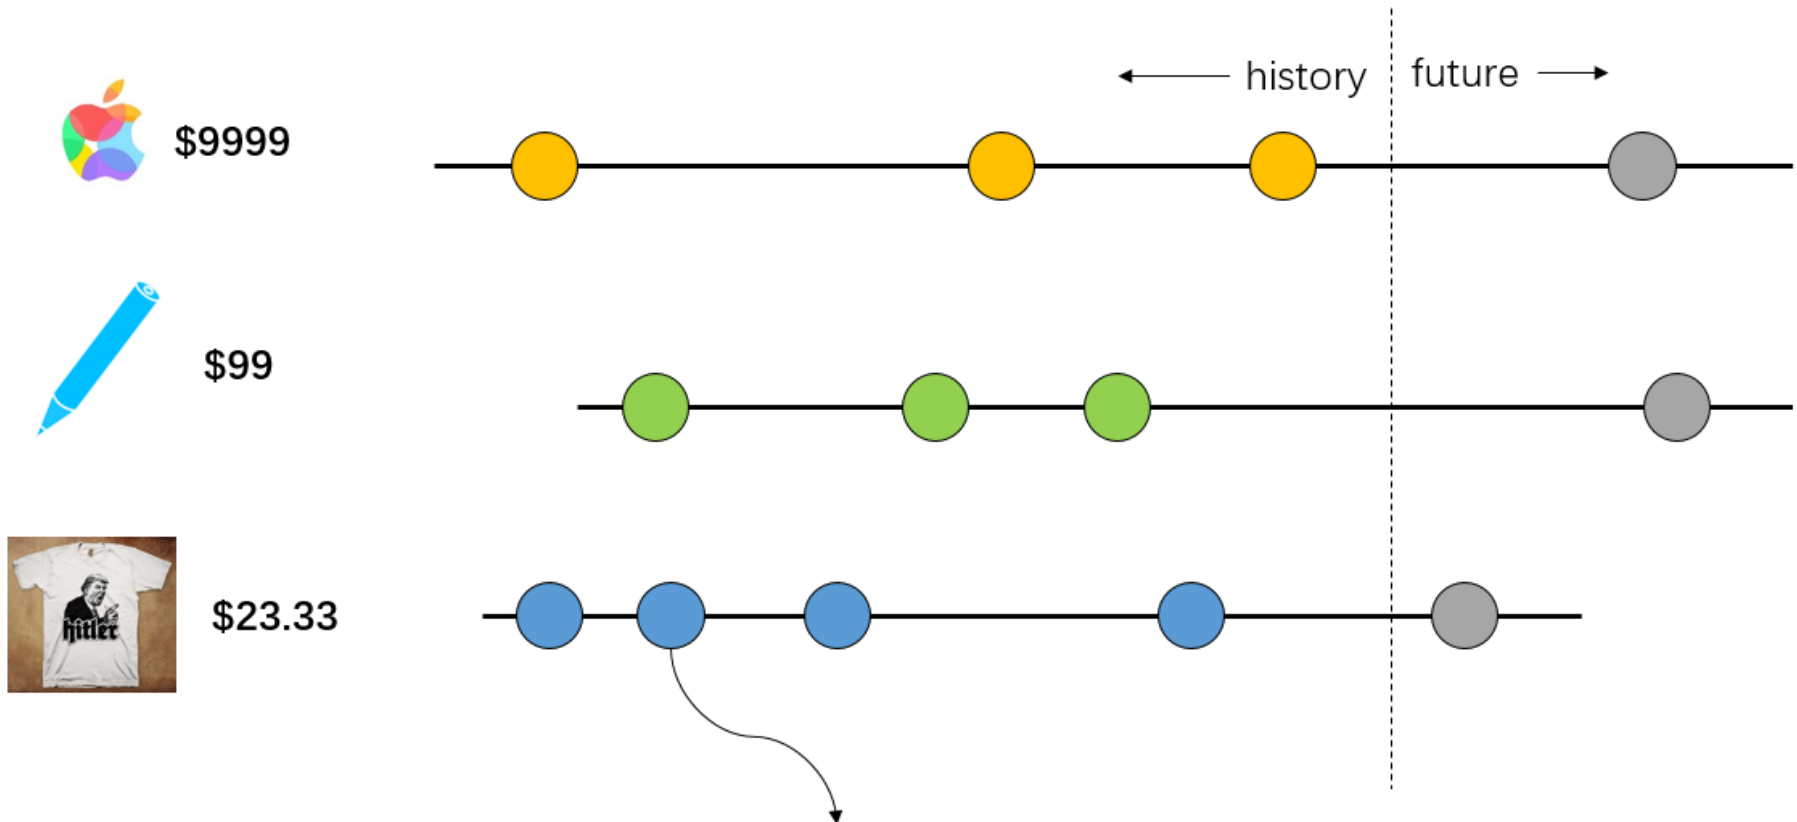

and

The Underlying
Monetary Network

What we have

Item cascades with their sell price

Junhua Chen bought a Trump T-shirt at 11.11 for \$23.33

Each dot is someone buy something

Why we need this?

Reserved Price
Monetary Network

No.1

NEED

New metrics for need crucial in new RS

No.2

Promotion

Spread a object In large social network

How to get this?

Reserved Price

Monetary Network

Find the Distribution
Reserved Price
Monetary Network

Model / Dist.

Cascades & Price

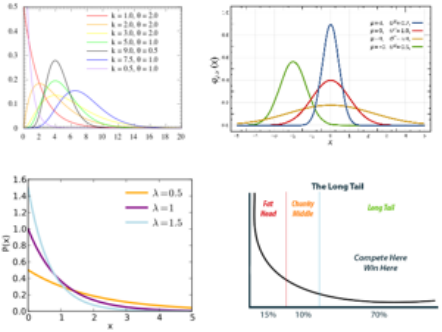

Reserved Price & Monetary Network

Find the Distribution Reserved Price Monetary Network

For Nodes

- Choosing the right one
- Parameter level

Find the Distribution

Reserved Price

Monetary Network

For Edges

- Aggregating the information
- Transfer into monetary concept

$$y = f(\text{aggregate inf. of precursors})$$

How to Measure?

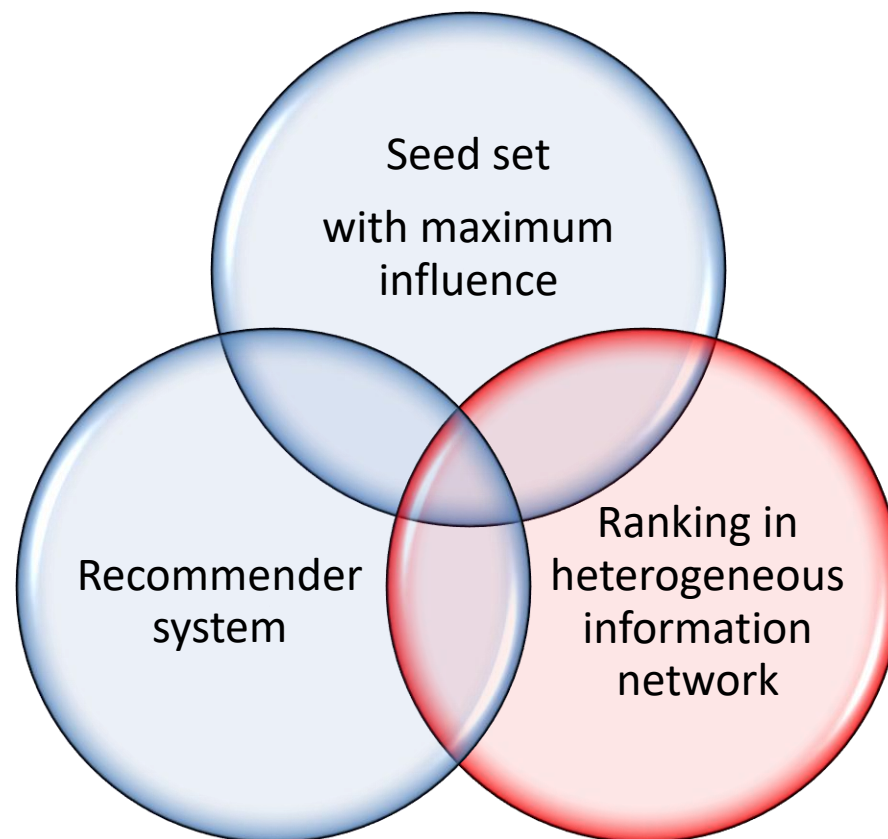

Reserved Price
Monetary Network

No
Real reserve price

No
Real monetary network

Importance **Ranking** in complex network

Hello, it's me again.
But this time, I
come with ranking.

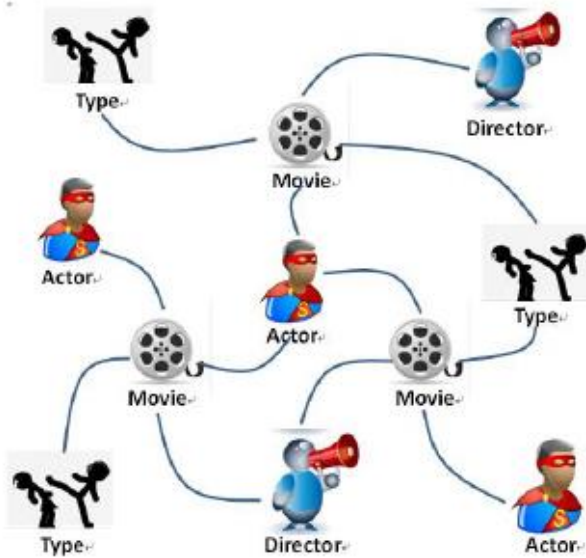

(a) Heterogeneous network of movie data

(b) Network schema

HIN:

Note: Heterogeneous information network (*abbrv. HIN*)

(a) Heterogeneous network of movie data

(b) Network schema

- **How to rank objects in *HIN*?**
 - The ranking of each type has its practical significance.

- **Simple ranking**

- Rules: Bigger degree of objects is, higher its ranking score is.
- Eg: in DBLP author's rank scores is proportional to the numbers of papers accepted by a conference. (conference).
- However: some people publish lots of papers in junk conferences.

- **Authority ranking**

- Rules: high ranked type X is more likely related to high ranked type Y if X and Y are connected in the schema of *HIN*.
- Eg: Jiawei Han & KDD in DBLP.

- **HRank**

- **Any Others ?**

(a) Heterogeneous network of movie data

(b) Network schema

- **How to utilize ranking results for other mining tasks in *HIN*?**

- Clustering
 - RankClus: iteratively ranking and clustering.
 - NetClus
- Classification
 - RankClass
- Recommender System
 - Ranking items according to similarity or relevance score

Table 1: A set of conferences from two research areas

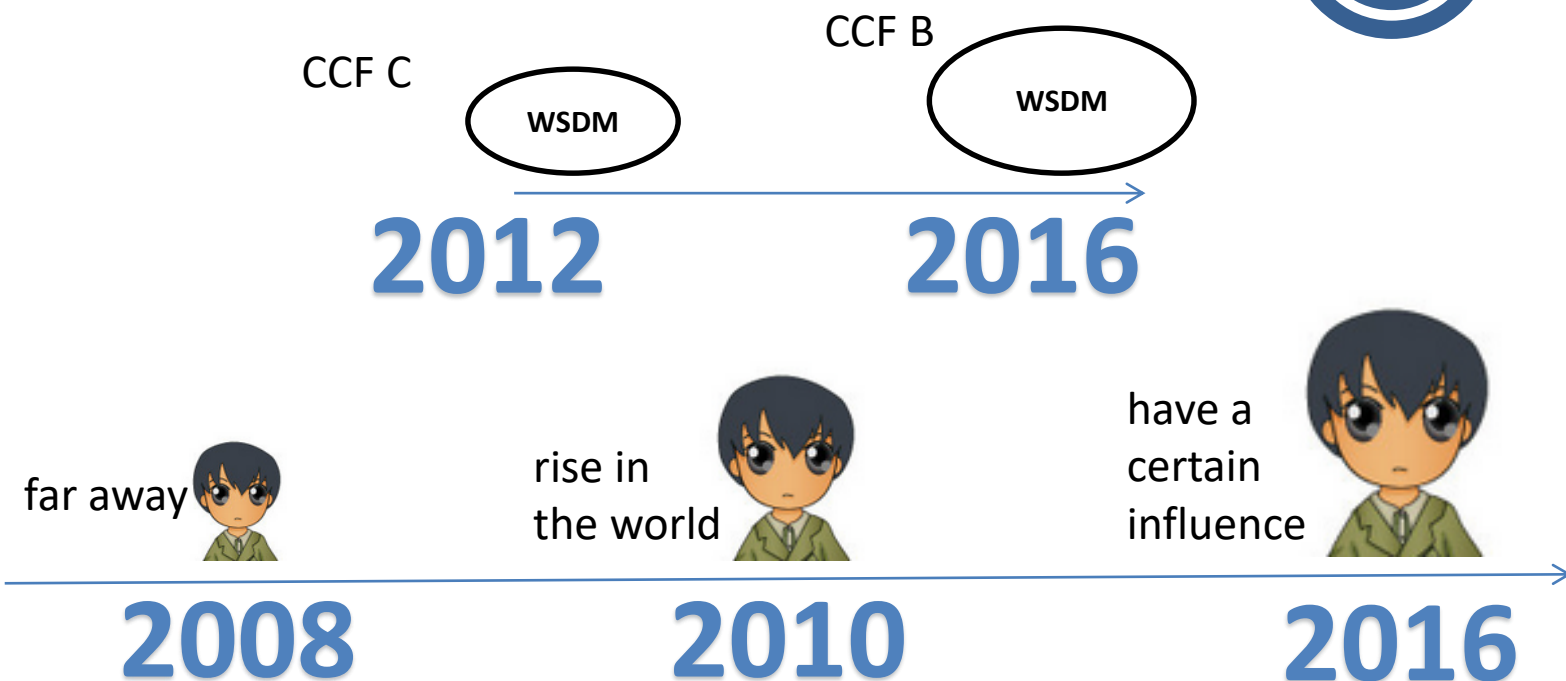

DB/DM	{SIGMOD, VLDB, PODS, ICDE, ICDT, KDD, ICDM, CIKM, PAKDD, PKDD}
HW/CA	{ASPLOS, ISCA, DAC, MICRO, ICCAD, HPCA, ISLPED, CODES, DATE, VTS }

Table 2: Top-10 ranked conferences and authors in the mixed conference set

Rank	Conf.	Rank	Authors
1	DAC	1	Alberto L. Sangiovanni-Vincentelli
2	ICCAD	2	Robert K. Brayton
3	DATE	3	Massoud Pedram
4	ISLPED	4	Miodrag Potkonjak
5	VTS	5	Andrew B. Kahng
6	CODES	6	Kwang-Ting Cheng
7	ISCA	7	Lawrence T. Pileggi
8	VLDB	8	David Blaauw
9	SIGMOD	9	Jason Cong
10	ICDE	10	D. F. Wong

Table 3: Top-10 ranked conferences and authors in DB/DM set

Rank	Conf.	Rank	Authors
1	VLDB	1	H. V. Jagadish
2	SIGMOD	2	Surajit Chaudhuri
3	ICDE	3	Divesh Srivastava
4	PODS	4	Michael Stonebraker
5	KDD	5	Hector Garcia-Molina
6	CIKM	6	Jeffrey F. Naughton
7	ICDM	7	David J. DeWitt
8	PAKDD	8	Jiawei Han
9	ICDT	9	Rakesh Agrawal
10	PKDD	10	Raghu Ramakrishnan

– Time-Aware: Evolving of Ranking in *HIN*.

- How to recommend to make a conference better(high rank score)?
- How to recommend to make a author more authoritative(high rank score)?

...

- Topic 1: Importance Ranking on complex network
 - Node-based
 - Edge-based
- Topic 2: Influence Maximization
 - Learn influence probability/weight
 - Other source of influence
 - Node's status
 - Influence maximization in multiple networks
- Topic 3: Recommender system
 - Learn reserved price
 - Learn monetary network
 - How to aggregate
 - How to interpret
- Topic 4: Ranking in heterogeneous information network
 - How to rank
 - Why to rank
 - **Time-aware ranking**
